

Solomon Johnbull Iyoubhebhe

Full-Stack Developer · Backend & Product Engineering (Java, React, TypeScript, Node.js)
+234 915 547 2765 | solomonjohnbull676@gmail.com | Ekpoma, Edo State, Nigeria | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

PROFILE

Full-stack developer who owns problems end-to-end, not just tickets. Across academic and personal projects, I've identified security and reliability gaps unprompted, made the architectural call to fix them, and shipped working mobile and web systems on shared Node.js/MongoDB backends. Comfortable across the stack — from REST API design and async job processing to React/React Native interfaces — and in remote, self-directed environments.

TECHNICAL SKILLS

- Front-End: TypeScript, JavaScript (ES6+), React, React Native, Expo, Tailwind CSS, Bootstrap, HTML5, CSS3
- Back-End: Java, Node.js/Express.js, REST APIs, Bull, Redis, JWT Auth
- Infrastructure & Databases: MySQL, PostgreSQL, MongoDB, Docker, Redis, Ubuntu/Linux
- Tools: Git, GitHub, VS Code, Android Studio, UI/UX Principles

EXPERIENCE

SportsID Inc. — Web & Mobile Development Intern

Jul 2025 – Mar 2026 · Remote

- Contributed to early-stage frontend feature development and third-party integrations for a sports platform within a collaborative startup team.
- Documented system workflows, UI structure, and feature requirements to support development planning and team coordination.
- Performed UI and functional testing across web pages, catching layout, usability, and integration issues before they reached demo sessions.
- Reported bugs and inconsistencies during iterative development, working cross-functionally with the team to resolve them.

PROJECTS

[Smart Attendance Ecosystem](#)

Jan 2026 – Mar 2026

React Native · React · TypeScript · Node.js · MongoDB | [GitHub](#)

- Identified a proxy-attendance vulnerability in the initial QR-code flow — students could screenshot or share codes to mark attendance for others — and redesigned the security model around geo-fencing and single-device-lock, closing the gap without adding friction to legitimate check-ins.
- Owned the real-time sync layer between the React Native student app and the React/TypeScript admin dashboard, designing MongoDB schemas and REST endpoints so attendance marked on mobile reflects instantly on the web dashboard.
- Built and shipped both client applications solo against a shared Node.js/MongoDB backend, managing the mobile/web split as a single owner rather than two disconnected codebases.

[Student Notification System](#)

Sep 2025 – Feb 2026

Node.js · REST APIs · JWT Auth · Bull · Redis | [GitHub](#)

- Built a Node.js backend exposing JWT-secured REST APIs to deliver real-time academic alerts to students and staff with low latency.
- Chose Bull/Redis queues over direct synchronous delivery to prevent API blocking under load, validating the design across 20+ simulated user accounts before treating it as production-ready.
- Deliberately decoupled notification logic from authentication so either could evolve independently; demoed to 10+ students and used their feedback to revise the delivery flow.

[Libroflow — Library Management System](#)

Feb 2026 – Apr 2026

Node.js · MongoDB · HTML · CSS | [GitHub](#)

- Designed the borrowing workflow end-to-end — availability checks, fines tracking, transaction history, automated overdue calculations — as a single connected system rather than isolated CRUD endpoints.
- Built a token-based auth system with role-specific dashboards and permissions for users and admins, so each role only sees and can act on what's relevant to it.

EDUCATION

Ambrose Alli University — B.Sc. Computer Science

Jun 2022 – Present

Ekpoma, Edo State

- Advanced Data Structures & Algorithms · Database Systems Management · Introduction to Cybersecurity · OOP with Java · Applied Software Engineering · Server-Side Programming (Python & Java)

CERTIFICATION

- Full-Stack Web Development Training — Aisotech Computer (MERN Stack, REST API Design, MVC Architecture, Git Workflows)
